# 1. INTRODUCTION

## 1.1 Project Overview

It's a significant and intriguing challenge to predict a car's performance level. The primary objective of the current study is to forecast automobile performance to enhance specific vehicle behaviour. This can greatly reduce the fuel consumption of the system and boost its effectiveness. Analysis of the vehicle's performance depending on the kind of engine, number of cylinders, fuel type, and horsepower, among other factors. The health of the automobile may be predicted based on these variables. Obtaining, investigating, interpreting, and documenting health data based on the three elements is a continuous process. Prediction engines and engine management systems both heavily rely on performance metrics like mileage, reliability, flexibility, and cost that may be combined. To increase the performance efficiency of the vehicle, it is crucial to analyse the elements utilizing a variety of well-known machine learning methodologies, including as linear regression, decision trees, and random forests. Automobile engineering's "hot subjects" right now revolve around the power, lifespan, and range of automotive traction batteries. We also take a performance in mileage into account here. We will create the models, utilizing various techniques and neural networks, to resolve this issue. Then, we'll compare which algorithm accurately predicts car performance (mileage).

## 1.2 Purpose

Predicting the performance level of cars is an important and interesting problem. The main goal is to predict the performance of the car to improve certain behaviors of the vehicle. This can significantly help to improve the system's fuel consumption and increase efficiency. The performance analysis of the car is based on the engine type, no of engine cylinders, fuel type, horsepower, etc. These are the factors on which the health of the car can be predicted. It is an ongoing process of obtaining, researching, analyzing, and recording health based on the above three factors. The performance objectives like mileage, dependability, flexibility and cost can be grouped together to play a vital role in the prediction engine and engine management system. This approach is a very important step towards understanding the vehicle's performance.

# 2. LITERATURE SURVEY

## 2.1 Existing problem

### a) An approach of modelling on dynamic performance evaluation for off-road vehicle:

Automobile dynamic is one of the most important performance indexes, the key is whether the simulation accords with the real status, whether the vehicle performance under real driving conditions can be reflected more validly, and it will be used to estimate automobile dynamic accurately, or to provide theory reference for vehicle design. On the point of view of using vehicle, considering the effects of external factors as air velocity, tyre slip, adhesion coefficient on vehicle dynamic performance, a novel method on dynamic performance evaluation is established, and the effectiveness of the dynamic performance model is verified.

### b) Steering performance simulation of three-axle vehicle with multi-axle dynamic steering:

Because three-axle heavy-vehicle with front-wheel steering has big radius at low speed and bad stability at high speed, in order to improve heavy vehicle steering performance at different speed, the multi-axle dynamic steering technology is put forward. Selecting zero side-slip angle of mass centre and proportional control strategy to control vehicle, Using MATLAB, the steering performance of the three-axle vehicle with different steering modes are simulated. The result shows that multi-axle

dynamic steering can decrease the steering radius at low speed and improve vehicle stability at high speed.

**c) Simulation study on synthetical performance of electric vehicles:**

This paper presents the software development on the performance simulation of electric vehicles. Software verification is carried out via the comparison of simulation results with on-road test. Applications of the software in prototype design are also presented in terms of theoretical inference, modelling, software development and simulation of synthetical performance for EVs such as dynamic performance, economy performance as well as analysis of parameters' influences on EV performance. The commonly used European drive cycle is adopted for simulation in the paper. Simulation with the software proves an efficient and money-saving means for prototyping of EV or HEV systems with control units.

**d) Simulation and Analysis of Performance of a Pure Electric Vehicle with a Super-capacitor:**

Energy storage and power boost are major problems in the development of electric vehicles (EV). Installing a super-capacitor as an auxiliary power source to improve the performance of electric vehicles is a feasible and realistic solution. In this paper, the structure of a multi-energy system and the principles of flow of the multi energy of electric vehicles were introduced first, explaining how different sources of energy work in different situations. A model of electric vehicle with a battery and a super capacitor, based on MATLAB/Simulink was built up. The model was validated by comparing the simulation results and the actual data from later field tests. The drive cycle used in the simulation was the CYC\_CONST\_45. Comparisons were made between the model of the vehicle with a super capacitor and the model of a vehicle without a super-capacitor. Field tests of an electric vehicle were conducted and analyses were made. The analysis includes vehicle dynamic performance and economic performance in urban environments where the vehicle accelerated and decelerated frequently. The results showed that installing a super-capacitor improves the working conditions of the battery. The variation of the current drawn by the vehicle was smoothed due to the working of the super-capacitor, which provided better working conditions for the battery and increased the operating life of the battery.

**e) Steering feel study on the performance of EPS:**

The steering feel study is very important in the development of electric power steering system (EPS). This paper describes a method about how to evaluate and get the suitable steering feel when driving a vehicle equipped with EPS. The EPS steering feel subjective tests were performed to obtain objective quality parameters that correlate with subjective evaluation. After this, the paper briefly describes the statistical technique used to identify which parameters best correlate with vehicle steering qualities. As there was no correlation between a single partial rating and a single objective indicator, the principal component analysis (PCA) method was chosen and obtained objective indices. The objective evaluation parameters have been validated by drivers' subjective evaluation. In the third part, the analytical method was applied to vehicle dynamic analysis to analyse vehicle steering feel characteristics, we established a closed-loop steering feel simulation model to analyse steering torque characteristics, vehicle dynamic response and assess steering feel performance for different settings of a EPS system. The design of EPS was optimized and achieved more suitable driving feel by using the dynamic analysis model without plenty of real vehicle tests. This method makes it possible to easily and accurately benchmark steering dynamic characteristics, set design targets, and is helpful to achieve good steering feel.

**f) Study on the performance and control of SR machine for vehicle regenerative braking:**

A regenerative braking system with simple structure, high efficiency, good performance and easy

control is crucial for electric vehicle (EV), hybrid electric vehicle (HEV) and fuel cell vehicle (FCV). SR machine is one of the promising candidates. In this paper, the current and torque performance of a SR machine for application to vehicle regenerative braking has been studied. The relationship between the torque, speed, turn-on and turn-off angles has been established. The data obtained through simulation is very useful for vehicle control design.

**g) A method to analyse driver influence on the energy consumption and power needs of electric vehicles:**

The energy consumption and power needs of electric vehicles are evaluated on roller test benches according to test procedures defined by legal standards and by vehicle manufacturers. These test procedures are mainly defined by driving cycles and include tolerances to compensate for the human error during these tests. These tolerances may seem to make the tests easier but they can have a big effect on the appropriate dimensioning of the components, and also on the performance of the vehicle. Within this paper, a method is presented, which enables the quantification of these effects depending on the type of the test procedure, and the way the driving cycle is driven. The developed method has been tested in a simulation environment and several standard test procedures were analysed.

**h) Autonomous underwater vehicle minimum-time navigation in a current field:**

The problem of navigation in a spatially variable current is reviewed, and for a certain class of mathematically-describable functions, solved for minimum time in closed form.

**i) Transmission system performance analysis of traditional power vehicle:**

Based on simulation software GT-drive, the author analysed the transmission system performance of a passenger car with diesel engine and provided the appropriate research methods. Firstly, the numerical simulation model of a vehicle was built based on vehicle weight, frontal area, rolling, air-drag coefficient, etc. The different matching schemes were simulated and compared. The results show that, for a given engine, using different transmission systems, the matching efficiency is significantly different. In view of power and economy of the vehicle, it is important that selected suitable power transmission device. This method has provided a theoretical basis for studying traditional power vehicle, also giving some information to study the new type vehicle power train system.

**j) Real-time performance of control allocation for actuator coordination in heavy vehicles:**

This paper shows how real-time optimisation for actuator coordination, known as control allocation, can be a viable choice for heavy vehicle motion control systems. For this purpose, a basic stability control system implementing the method is presented. The real-time performance of two different control allocation solvers is evaluated and the use of dynamic weighting is analysed. Results show that sufficient vehicle stability can be achieved when using control allocation for actuator coordination in heavy vehicle stability control. Furthermore, real-time simulations indicate that the optimisation can be performed with the computational capacity of today's standard electronic control units.

## 2.3 Problem Statement Definition

### **Machine Learning Based Vehicle Performance Analyser**

The user is an Automobile manufacturer, who is looking for new technologies to dominate the extremely competitive automobile market.

### **Who does the problem affect?**

The problem affects automobile companies struggling with improving their vehicle performance.

### **What are the boundaries of the problem?**

Automobile manufacturing & testing process; Automobile repair & service process; People who wish to know the performance of their vehicles.

### **What is the issue?**

Requirement to analyse the vehicle fuel economy, integrated safety, drivability, durability, features, aerodynamic performance, etc.

### **When does the issue occur?**

Increasing fuel prices forces vehicles to have higher fuel efficiency for becoming a market hit. Automobiles require constant introduction of new features to survive in the rapidly expanding auto

mobile industry.

People prefer maintenance of old vehicles than buying new vehicle, which require automobiles to provide better and easier maintenance of their vehicles.

People feel better when they are constantly updated on their vehicle performance, vehicle safety standards, etc.

### Where is the issue occurring?

Automobile manufacturing companies, Automobile service stations, People, etc.

### Why is it important that we fix the problem?

Vehicle performance analyser does not only benefit the automobile companies or the people using it. Improving vehicle performance by analysing the vehicle, leads to betterment of the vehicles in various aspects. For instance, improving fuel efficiency conserves fuel, reducing the emissions reduces the stress on the environment, etc.

## 3. IDEATION & PROPOSED SOLUTION

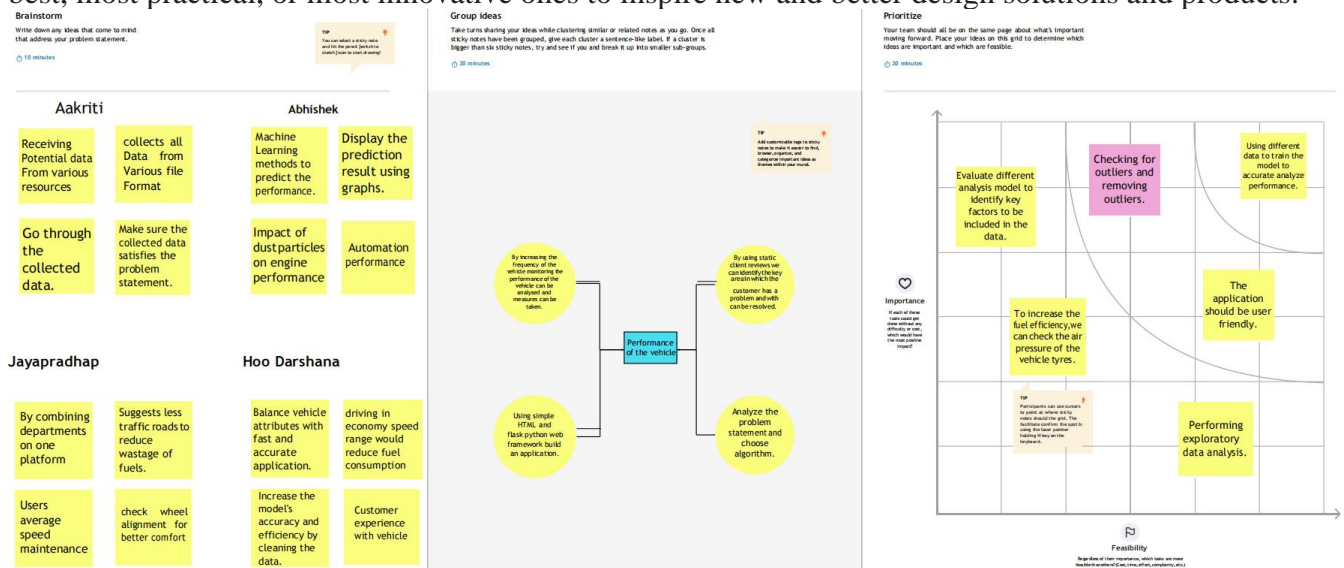

### 3.1 Empathy Map

The primary purpose of the empathy map is to bridge the understanding of the user and developer.

### 3.2 Ideation & Brainstorming

The aim is to generate a large quantity of ideas that the team can then filter and cut down into the best, most practical, or most innovative ones to inspire new and better design solutions and products.

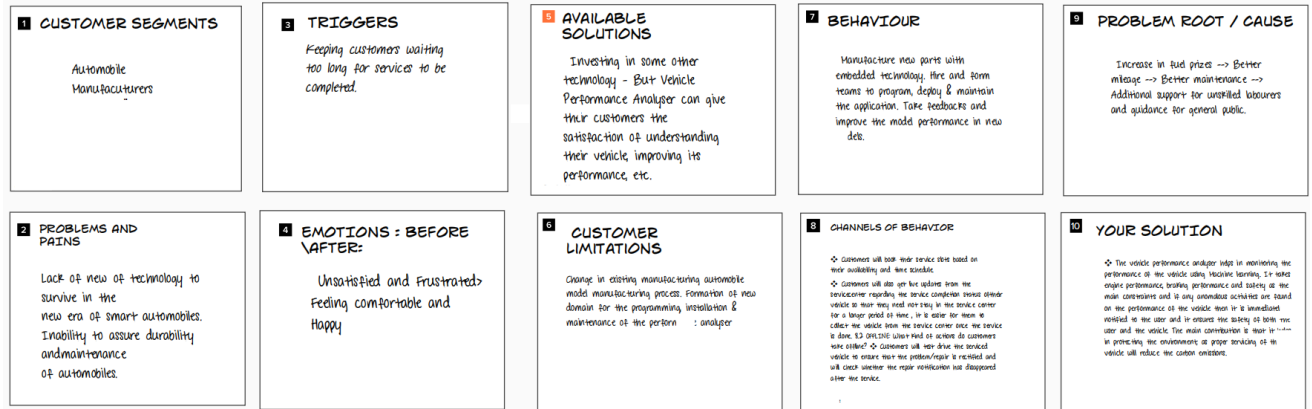

### 3.3 Proposed Solution

| S.no. | Parameter                                | Description   |
|-------|--|---|
| 1.    | Problem Statement (Problem to be solved) | <p>Predicting the performance level of cars is an important and interesting problem. The main goal is to predict the performance of the car to improve certain behaviours of the vehicle. This can significantly help to improve the system's fuel consumption and increase efficiency.</p> <p>The performance analysis of the car is based on the engine type, no of engine cylinders, fuel type, horsepower, etc. These are the factors on which the health of the car can be predicted. It is an on-going process of obtaining, researching, analysing, and recording health based on the above three factors.</p> <p>The performance objectives like mileage, dependability, flexibility and cost can be grouped together to play a vital role in the prediction engine and engine management system. This approach is a very important step towards understanding the vehicle's performance.</p> |
| 2.    | Idea/Solution description                | To train the system with the dataset using a regression model and it will be integrated to the web-based application where the user is notified with the status.  |
| 3.    | Novelty/ Uniqueness                      | Giving the public and the manufacturer the feature to analyse their vehicle's performance.  |
| 4.    | Social Impact / Customer Satisfaction    | The petrol/diesel cost can become lower due to a better mileage performance and the existing vehicle parts can be reused which increases the re-usability thus decreases the cost on new products and the physically able people have better seat comfort because of accessories work. Better mileage and better engine maintenance provides complete combustion thus emitting less harmful gases.  |

|    |                                |   |
|----|--------------------------------|---|
| 5. | Business Model (Revenue Model) | The web-based application has a friendly UI for the customer to enter their vehicles detail and the system predicts the value within few seconds. |
| 6. | Scalability of the Solution    | The project will be scalable when the parts used to measure data in vehicles is feasible and the ML model is fast in processing data.             |

### 3.4 Problem Solution fit

## 4. REQUIREMENT ANALYSIS

### 4.1 Functional requirements

| Fr no. | Functional requirement (epic)          | Sub requirement (story / sub-task)              |
|--------|--|---|
| FR-1   | User Registration                      | Registration through Website                    |
| FR-2   | Entering the specifications of the car | Obtaining the specs of the car                  |
| FR-3   | Performance analysis                   | Analysing the performance of the car.           |
| FR-4   | Results of the analysis                | Displaying the required result to the customer. |

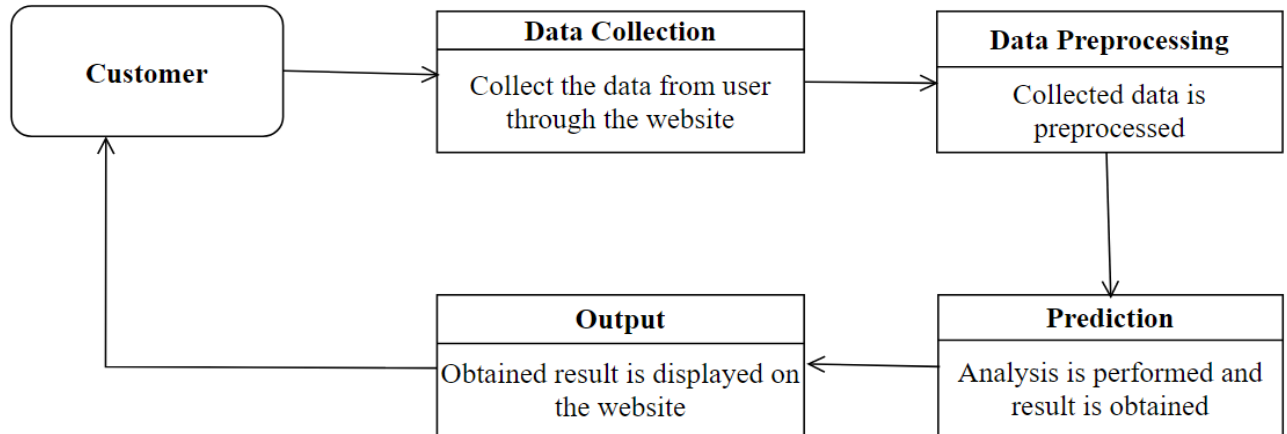

### 4.2 Non-Functional requirements

| NFR No. | Non-Functional Requirement | Description   |
|---------|----------------------------|---|
| NFR-1   | Usability                  | Predicting the car's performance.                             |
| NFR-2   | Security                   | Providing the website with basic security.                    |
| NFR-3   | Reliability                | Providing accurate performance values for the vehicle.        |
| NFR-4   | Performance                | Improving performance by utilizing an efficient ML algorithm. |
| NFR-5   | Availability               | Available to anyone and anytime.                              |
| NFR-6   | Scalability                | Will be able to handle multiple users.                        |

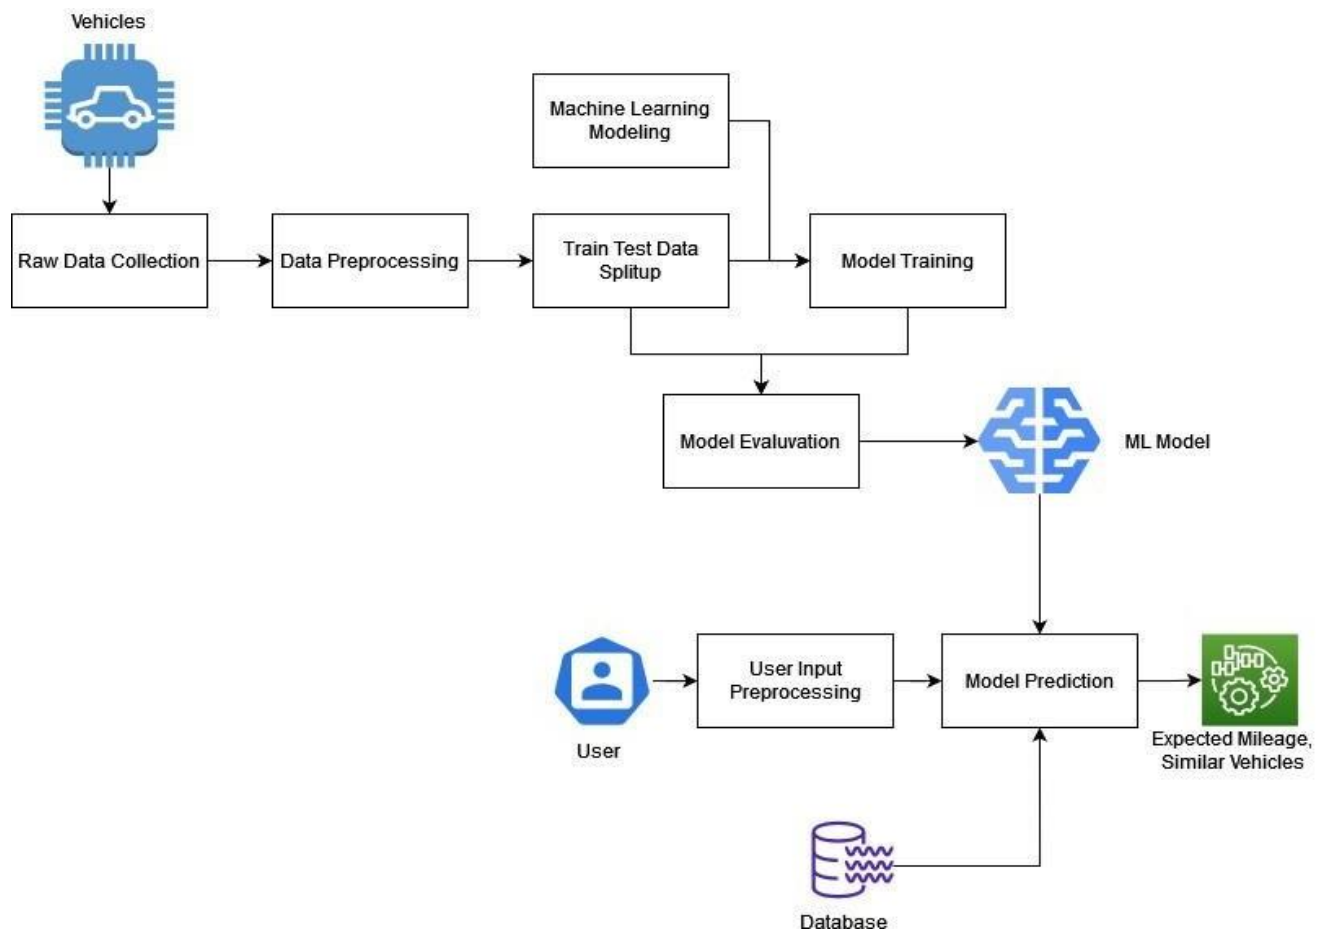

## 5. PROJECT DESIGN

### 5.1 Data Flow Diagrams

A Data Flow Diagram (DFD) is a traditional visual representation of how information flows within a system. A neat and clear DFD can thus depict the right amount of the system requirements graphically. It not only shows how data enters and leaves the system, but also what changes the information and where the data is stored.

### 5.2 Solution & Technical Architecture

### 5.3 User Stories

| User Type               | Functional Requirement (Epic) | User Story Number | User Story/Task  | Acceptance criteria | Priority | Release  |
|-------------------------|-------------------------------|-------------------|--|---------------------|----------|----------|
| Customer (Desktop user) | Input                         | USN-1             | User can enter the car details in the website.                         | Enters car details. | High     | Sprint-1 |
| Customer (Desktop User) | Output                        | USN-2             | User can obtain performance metrics and the analysis from the website. | Obtain the results. | High     | Sprint-4 |

## 6. PROJECT PLANNING & SCHEDULING

### 6.1 Sprint Planning & Estimation

| Sprint   | Functional Requirement (Epic) | User Story Number | User Story / Task   | Story Points | Priority | Team Members  |
|----------|-------------------------------|-------------------|---|--------------|----------|---|
| Sprint-1 | Data processing               | USN-1             | As a user, I can process raw data and perform manual analysis.  | 30           | High     | Aakriti<br>Abhishek<br>Hoo Dharshana<br>Jayapradhap |
| Sprint-2 | Model building                | USN-2             | As a user, I can get the predicted performance of the vehicle using the given data.                                   | 20           | Low      | Aakriti<br>Abhishek<br>Hoo Dharshana<br>Jayapradhap |
| Sprint-3 | Web Page design               | USN-3             | As a user, I am able to view the website and I can get the predicted performance of the vehicle using the given data. | 30           | High     | Aakriti<br>Abhishek<br>Hoo Dharshana<br>Jayapradhap |
| Sprint-4 | Result                        | USN-4             | As a user, I expect the prediction is highly accurate.  | 20           | High     | Aakriti<br>Abhishek<br>Hoo Dharshana<br>Jayapradhap |

## 6.2 Sprint Delivery Schedule

| Sprint   | Total Story Points | Duration | Sprint Start Date | Sprint End Date | Story Points Completed | Sprint Release Date |
|----------|--------------------|----------|-------------------|-----------------|------------------------|---------------------|
| Sprint-1 | 30                 | 6 days   | 21 Oct 2022       | 26 Oct 2022     | 30                     | 26 Oct 2022         |
| Sprint-2 | 20                 | 6 days   | 28 Oct 2022       | 03 Nov 2022     | 20                     | 03 Nov 2022         |
| Sprint-3 | 20                 | 6 days   | 04 Nov 2022       | 09 Nov 2022     | 20                     | 09 Nov 2022         |
| Sprint-4 | 20                 | 6 days   | 11 Nov 2022       | 16 Nov 2022     | 20                     | 16 Nov 2022         |

## 6.3 Reports from JIRA

### Velocity:

Imagine we have a 10-day sprint duration, and the velocity of the team is 20 (points per sprint). Let's calculate the team's average velocity (AV) per iteration unit (story points per day).

$$\text{Average Velocity} = \frac{\text{sprint duration}}{\text{velocity}} = \frac{20}{10} = 2$$

### Burndown Chart:

A burndown chart is a graphical representation of work left to do versus time. It is often used in agile software development methodologies such as Scrum. However, burn down charts can be applied to any project containing measurable progress over time.

## 7. CODING & SOLUTIONING

### 7.1 Feature 1

#### Data Pre-processing

##### Importing the Libraries

```
In [2]: import numpy as np
import pandas as pd
import matplotlib.pyplot as plt
import seaborn as sns
```

##### Loading the Dataset

```
In [3]: df=pd.read_csv('Dataset/car_performance.csv')
```

##### Data Analysis

```
In [4]: df.head(10)
```

```
Out[4]:
```

|   | mpg  | cylinders | displacement | horsepower | weight | acceleration | model year | origin | car name                  |

### 8.2 User Acceptance Testing

#### 1. Purpose of Document

The purpose of this document is to briefly explain the test coverage and open issues of the [ProductName] project at the time of the release to User Acceptance Testing (UAT).

#### 2. Defect Analysis

This report shows the number of resolved or closed bugs at each severity level, and how they were resolved

| Resolution     | Severity 1 | Severity 2 | Severity 3 | Severity 4 | Subtotal |
|----------------|------------|------------|------------|------------|----------|
| By Design      | 1          | 1          | 0          | 0          | 2        |
| Duplicate      | 1          | 0          | 0          | 0          | 1        |
| External       | 1          | 0          | 0          | 0          | 1        |
| Fixed          | 1          | 1          | 1          | 1          | 4        |
| Not Reproduced | 0          | 0          | 0          | 0          | 0        |
| Skipped        | 0          | 0          | 0          | 0          | 0        |
| Won't Fix      | 0          | 0          | 0          | 0          | 0        |
| Totals         | 4          | 2          | 1          | 1          | 13       |

#### 3. Test Case Analysis

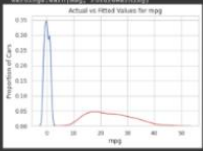

This report shows the number of test cases that have passed, failed, and untested

| Section            | Total Cases | Not Tested | Fail | Pass |
|--------------------|-------------|------------|------|------|
| Print Engine       | 4           | 0          | 0    | 4    |
| Client Application | 4           | 0          | 0    | 4    |
| Security           | 1           | 0          | 0    | 1    |

|                     |   |   |   |   |
|---------------------|---|---|---|---|
| Outsource Shipping  | 0 | 0 | 0 | 0 |
| Exception Reporting | 1 | 0 | 0 | 1 |
| Final Report Output | 4 | 0 | 0 | 4 |
| Version Control     | 1 | 0 | 0 | 1 |

## 9. RESULTS

### 9.1 Performance Metrics

| S.No.    | Parameter                         | Values   | Screenshot  |

It is also known as the coefficient of determination, or the coefficient of multiple determination for multiple regression. R_squared = Explained variation / Total variation Mean Squared Error (MSE) The Mean Squared Error measures the average of the squares of errors, that is, the difference between actual value (y) and the estimated value (ŷ).  (45) from sklearn.metrics import r2_score,mean_squared_error (46) r2_accuracy_test_y_pred3) 0.969000867569933 (47) mean_squared_error(y_test,y_pred3) 0.138094072231067 (48) np.sqrt(mean_squared_error(y_test,y_pred3)) 0.371610418022128 </pre> <p>Random forest regressor</p> <pre> (49) from sklearn.metrics import r2_score,mean_squared_error (50) r2_accuracy_test_y_pred3) 0.9734430941432 (51) mean_squared_error(y_test,y_pred3) 0.0807607940385779 (52) np.sqrt(mean_squared_error(y_test,y_pred3)) 0.284218022292946 </pre> <p>Linear regression</p> <pre> ( ) from sklearn.metrics import r2_score,mean_squared_error r2_accuracy_test_y_pred3) 0.8631101197005312 ( ) mean_squared_error(y_test,y_pred3) 0.116889881299488 ( ) np.sqrt(mean_squared_error(y_test,y_pred3)) 0.3419061244762822 </pre> <p>Conclusion:<br/> When comparing models, the model with the higher R-squared value is a better fit for the data.<br/> When comparing models, the model with the smallest MSE value is a better fit for the data.<br/> Comparing these three models, we conclude that the DecisionTree model is the best model to be able to predict mpg from our dataset.</p> |
| Accuracy | Training Accuracy - 0.91724492094 |  | <pre> 93) plt.figure(figsize=(10,5)) 94) plt.plot(y_test,y_pred3) 95) plt.xlabel('Actual') 96) plt.ylabel('Predicted') 97) plt.title('Actual vs Predicted Values for mpg') 98) plt.show() </pre>  <p>We can see that the fitted values are reasonably close to the actual values, since the two distributions overlap a bit. However, there is definitely some room for improvement.</p> <pre> (103) from sklearn.metrics import r2_score,mean_squared_error (104) r2_accuracy_test_y_pred3) 0.917244920941432 </pre>  |

## **10.ADVANTAGES & DISADVANTAGES**

### **Advantages**

- Using the Random Forest Algorithm in the model helps to perform both classifications as well as regression tasks.
- A random forest produces good predictions that can be easily understood.
- It can handle large datasets easily.
- Random Forest Algorithm provides a higher-level accuracy in predicting outcomes.

### **Disadvantages**

- The main limitation of using random forest algorithm in the model is that a large number of trees can make the algorithm too slow and ineffective for real-time predictions.
- The random forest algorithm is quite slow to create predictions once it is trained.

## **11.CONCLUSION**

The ability to estimate a car's performance level presents a big and fascinating challenge. Forecasting vehicle performance in order to improve particular vehicle behaviour was our main goal. Performance evaluation of the car considering its horsepower, cylinder count, acceleration, fuel type, and engine type, among other things. Based on the factors, like horsepower, cylinder count, fuel type, and engine type, the health of the car is forecasted. We analysed the components using a number of well-known machine learning approaches, like linear regression, decision trees, and random forests, in order to optimize the performance efficiency of the vehicle. The power, longevity, and range of automobile traction batteries are now the trends in automotive engineering. In this case, we additionally consider mileage performance. To answer this problem, we have built the models using a variety of methods and neural networks. We've then compared which algorithm is most accurate in forecasting car performance (Mileage). A front-end webpage was designed to help give the user an attractive front while they input the values required by the developed machine learning model. The IBM cloud platform was used to develop the model.

## **12.FUTURE SCOPE**

The dataset used for this model is an old vehicle dataset, thus the model's accuracy would drop when the details of vehicles released in recent times are given as input. Thus, in the future we propose to use the latest dataset set containing vehicle information to help train the model. We also plan to use other classification algorithms such as SVM and Decision Tress instead of Random Forest and measure if any accuracy gain occurs. Finally, we propose to scale the machine learning model to also analyse the performance of a larger range of vehicles.
